The provided React code represents the frontend of a fictitious KFC (Kentucky Fried Chicken) website. Let's break down the functionality and components of the frontend:

### **1. Overview:**

The website frontend serves as a user interface for customers to view the KFC menu, categorize items, add them to a shopping cart, and view the total cost of selected items.

### **2. Components:**

The frontend is divided into several components:

#### **A). KFCMenu Component:**

- Displays the main content of the website.
- Shows a visually appealing header section with a background image.
- Presents the KFC menu categorized into Chicken, Sidedishes, Beverages, and Desserts.
- Each category displays items with their names, prices, and images.
- Provides buttons to add items to the shopping cart.

#### **B). Shopping Cart Component:**

- Displays a list of items that the user has added to their shopping cart.
- Each item in the cart shows its name, price, and a button to remove it from the cart.
- Calculates and displays the total cost of items in the cart.

### **3. Functions:**

- `addToCart(item)`: Adds a selected menu item to the shopping cart.
- `removeFromCart(index)`: Removes an item from the shopping cart based on its index.
- `calculateTotal()`: Calculates the total cost of items in the shopping cart.

### **4. Styling**

- Applies inline styles for setting the background color and image of the header section.
- Imports an external CSS file (`'menu.css'`) for additional styling.
